

Hotbox? You'd better believe it!

There's never a doubt about false hotbox transmission indications with the Lenkurt 960A Journal Data Transmission System. It provides a constant recorder baseline for accurate hotbox indications requiring no special interpretation.

The 960A uses a time pulse technique which is practically impervious to line interference. And it can even handle trains traveling at *100 mph* without missing a single journal.

The channel assignments of the 960A are designed for use on code wires and can be integrated economically with communications networks for full centralization. One voice chan-

nel can handle six 960A channels—three hotbox checkpoints.

If you're on the lookout for hotboxes, get a journal data transmission system you can trust: Our 960A. You can believe it. Lenkurt Electric Co., Inc., San Carlos, California. Other offices in Atlanta, Chicago, Dallas, New York City.
