

# Unsinkable Railroad

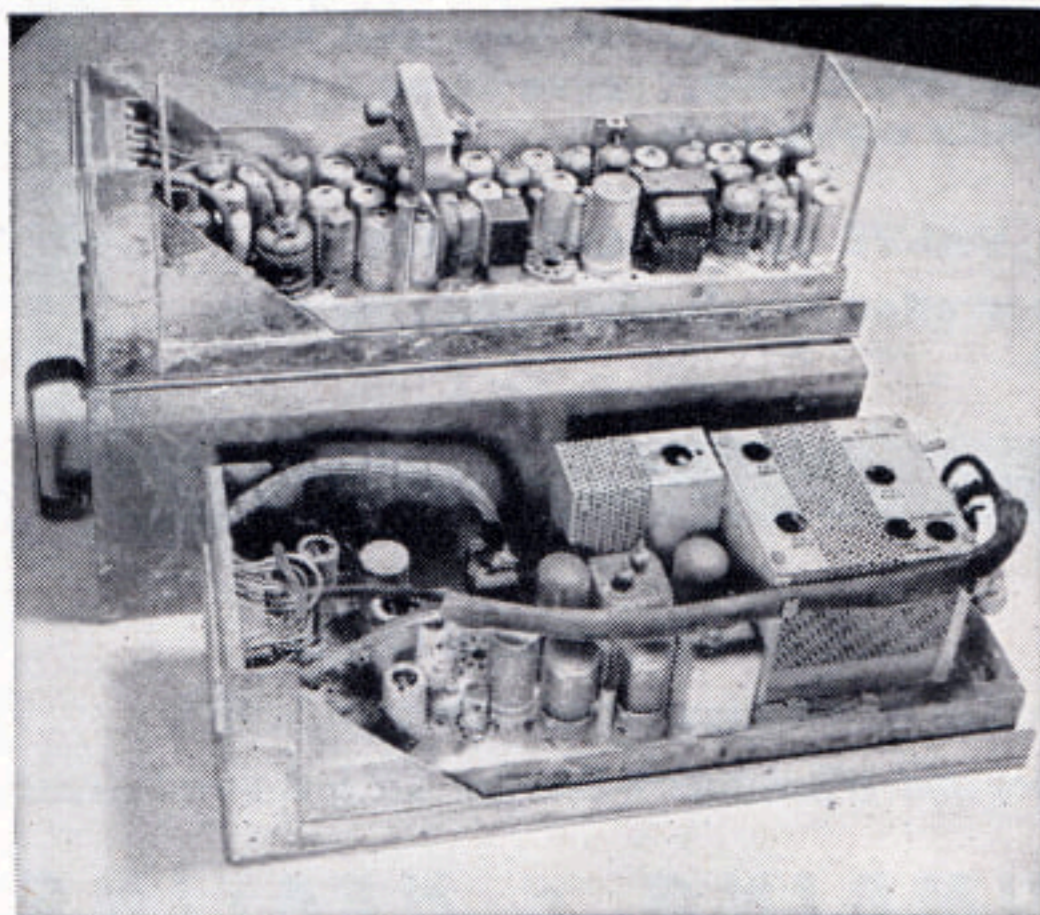

Typical scene of recent Missouri Valley Flood.

Muck-laden Motorola units as they came from flooded engines and cabooses.

Components well protected by wax impregnation—require only minor servicing.

## —with unsinkable communications

The recent Missouri Valley flood furnished further evidence of Union Pacific foresight!

...and demonstrates again that it takes more than mud and water to hurt Motorola units (for they are built to go through arctic cold, jungle heat, severe shock, dust, dirt and driving rain).

How much damage could those days in the Missouri River do? Just wash off the units, dry thoroughly, make a few minor part replacements and they're back "in business," good as new—with the guaranteed permanent selectivity—with the sealed-in-plastic Permakay wave filters (Motorola-guaranteed for the life of the set)—with 15 nuisance adjustments eliminated with the selectivity performance remaining exactly as the day it left the factory! That's *Reliability—all the way!*
