

No clean cab radio outperforms the Trackstar III at any price.

Now, Harmon offers even more quality and more features in the latest generation of our popular Trackstar radios: Trackstar III.

The Trackstar III, like its predecessors, is a single, mechanically rugged two-way radio designed specifically to fit in the communications module of clean cab locomotives.

But the Trackstar III is also fully synthesized. It offers the operator his choice of dispatch tones and DTMF tones from a 3 x 4 DTMF pad on the front

of the radio or select-then-send pushbuttons.

The Trackstar III operates on all 97 A.A.R. Standard Communications Channels. And up to 99 commonly used channels are also selectable by the operator with an additional set of "Home" channel select buttons and display.

The Trackstar III has lots more standard and optional features and one of the most outstanding is our price tag. For more information, call us toll-free or use our reader response number.
